Tech setup

From a Salesforce org to Process Intelligence: the pipeline behind the demo

Luke Audie · October 2026

Tech setup: from a Salesforce org to an event log

pipeline/extract.py

3 SOQL over REST via CLI

```
QUERIES = {
    "opportunities": """
    SELECT Id, Name, Amount, StageName, IsWon, IsClosed,
           LeadSource, CreatedDate, CloseDate, OwnerId, Owner.Name,
           Account.Industry, Account.BillingCountry
    FROM Opportunity""",
    "stage_history": """
    SELECT OpportunityId, StageName, CreatedDate,
           CreatedById, CreatedBy.Name
    FROM OpportunityHistory
    ORDER BY OpportunityId, CreatedDate""",
    "tasks": """
    SELECT WhatId, Subject, CreatedDate, CompletedDateTime,
           OwnerId, Owner.Name, Status
    FROM Task
    WHERE What.Type = 'Opportunity'""",
    "leads": """
    SELECT Id, CreatedDate, ConvertedDate, ConvertedOpportunityId,
           OwnerId, Owner.Name
    FROM Lead
    WHERE IsConverted = true
      AND ConvertedOpportunityId != null""",
}
```

4 History → events

5 Tasks join on WhatId

Salesforce trial org: seed.py loaded 40 [Demo] deals through real stage changes to simulate a client's CRM.

extract.py: four SOQL queries over the REST API, signed by the Salesforce CLI session. Opportunity Id becomes the case ID.

Everything is live and open to inspect
