From Salesforce data to a framed value case

Simulated value case with a working Salesforce extraction pipeline

Luke Audie · October 2026

Illustrative annual upside: $1.4M at 50% capture

$1.4M

Gross scenario across three overlapping opportunities, before deduplication. Full gap: $2.8M.

Illustrative: 800 simulated opportunities in Salesforce's object shape (10.4 months). The same pipeline runs live on 40 seeded opportunities in a Salesforce trial org.

Accelerate revenue

EMEA discount approvals take 7.0 days vs 1.2 in the fastest region.

Improve win rate

19% of negotiated deals loop back for a re-quote; they win 31% vs 49%.

Sales productivity

12% of deals skip Qualification and win 18% vs 39%.

800	37%	33.9d	67	14%
deals analysed	win rate	median cycle time	distinct paths	match the winning trace

Salesforce → event log → process mining → value case

Approach: from finding value to realising it

Today

1

Identify

Mine the CRM event log: process map, variants and bottlenecks.

Output: 3 opportunities found

2

Frame

Size each opportunity from its KPI baseline and illustrative assumptions to validate with process owners.

Output: $2.8M gross scenario

3

Commit

Validate KPI definitions and values with each opportunity owner.

Output: Signed-off committed value

4

Realize

Act on the root cause, then track the KPI against its baseline.

Output: Value realised, reported quarterly

This demo covers Identify and Frame on Salesforce data. Commit and Realize run with the customer's process owners.

Discover: paths in the simulated event log

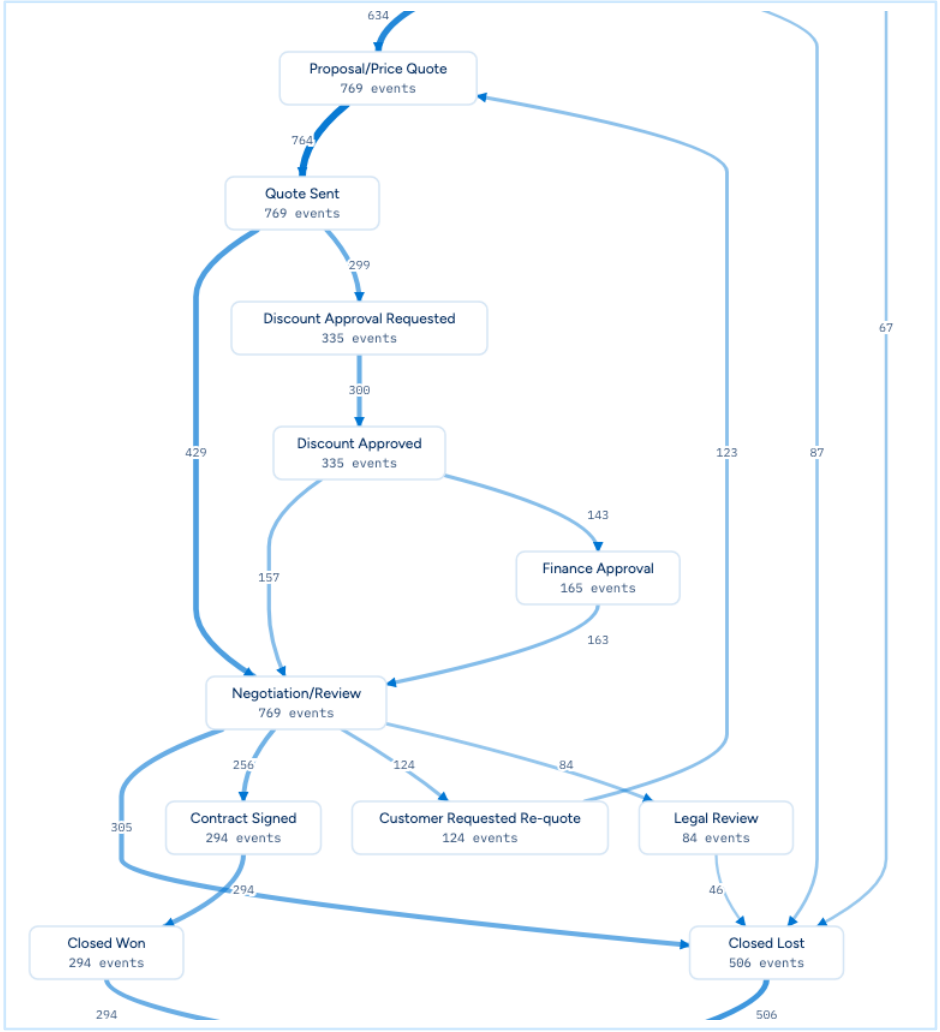

14% match the selected winning trace (38% of won deals)

67 distinct paths across 800 deals

7.0 days median EMEA approval wait, the slowest hand-off

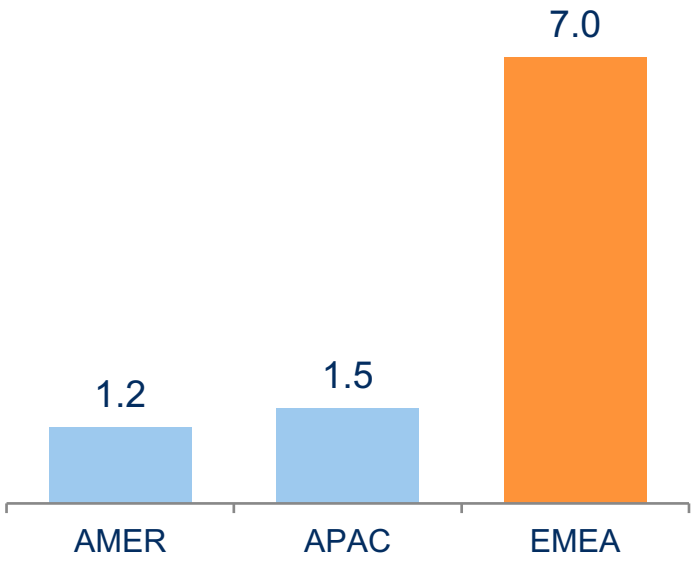

Approval steps and re-quote loops show up as detours from the winning trace.

Open the live process map →

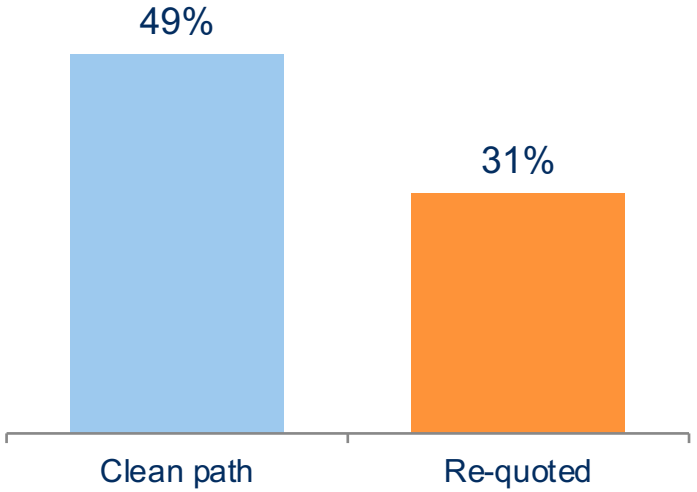

Diagnose: three patterns associated with lower win rates

Median approval wait (days)

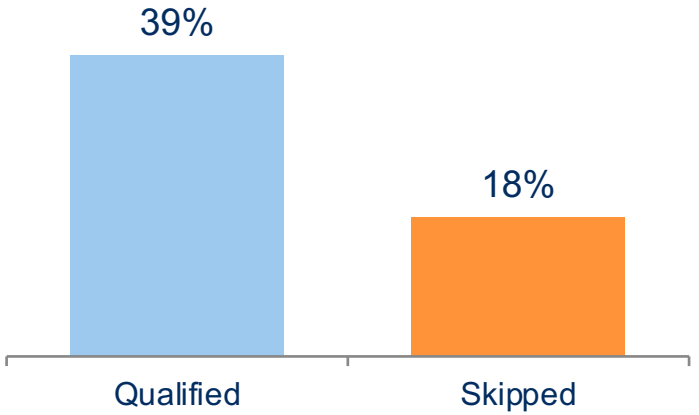

EMEA approvals take 5.8 days longer than the fastest region (103 EMEA approvals).

Win rate of negotiated deals

Re-quoted deals win 18 points less often (n = 124 re-quoted vs 521 clean).

Win rate by qualification

Deals that skip Qualification win 21 points less often (n = 99 vs 701).

Business case overview: three opportunities, one deep-dive

Objective	Opportunity	Proposed owner	Time to value	Full gap	Committed	Realized
Accelerate revenue	1 EMEA discount approvals	Deal desk lead	Short	$213k	TBD	—
Improve win rate	**2 Re-quotes (deep-dive)**	**VP Revenue Ops**	**Medium**	**$1.33M**	**TBD**	**—**
Sales productivity	3 Skipped qualification	Sales operations	Short	$1.29M	TBD	—
Total (gross)				**$2.84M**	TBD	—

Full gap = illustrative scenario from simulated Salesforce data. Committed is agreed with each owner after validation; realized is tracked against a frozen baseline.

Opportunities overlap
22 deals are both re-quoted and unqualified, 7 re-quoted with slow approvals, 5 unqualified with slow approvals.

So the total is gross: incremental wins must be counted once per opportunity before anything is committed.

Before value is committed

- [ ] Deduplicate overlapping deals across opportunities
- [ ] Agree cohort, period and Amount basis
- [ ] Owner signs off KPI definition and improvement assumption
- [ ] Finance signs off the value formula

Value case: reduce re-quotes in quote-to-close

Time frame: 2025-10 to 2026-09 · Deals that reached Negotiate · Proposed owner: VP Revenue Operations · Simulated data

Challenge

- 747 negotiated deals a year; 19% loop back for a re-quote
- Re-quoted deals win 31% vs 49%
- EMEA approvals take 7.0 days vs 1.2

Root cause (to capture)

- Reason codes: quote expired, discount, scope, pricing error
- Hotspots by approver queue, region and rep
- Test whether approval delay causes expiry and re-quotes

Solution with process intelligence

- Performance views show where quotes wait and loop
- Conformance checking flags skipped steps
- Simulate a pilot before any policy change

Negotiated deals / yr		Share re-quoted		Win-rate gap		Average won deal		Scenario capture		
747	×	19.2%	×	17.5 pts	×	$53.1k	×	50%	=	≈ $667k modelled upside p.a.

Assumptions: simulated data, annualised over the 10.4-month event window (illustrative run rate); Amount = opportunity bookings; win-rate gap is an association among deals that reached Negotiate; 50% capture is a scenario. Tracking: share re-quoted vs a frozen baseline of 19.2%, win rate vs a comparison group; Finance validates realized revenue.

Turning the finding into a decision

Validate

Run the extract on the production org; confirm cohorts, causes and overlap.

RevOps + SE · weeks 1–2

Pilot

Agree a controlled pilot with RevOps and Finance once re-quote causes are validated.

RevOps + Finance · weeks 3–8

Measure

Track share re-quoted and win rate against a frozen baseline and a comparison group.

Finance · monthly, signed off quarterly
