Tech setup

The pipeline behind the demo: Salesforce data to an event log

Luke Audie · October 2026

From a Salesforce org to an event log

pipeline/extract.py · stage history

3 SOQL via the CLI session

```
SELECT OpportunityId, StageName, CreatedDate,
       CreatedById, CreatedBy.Name
FROM OpportunityHistory
ORDER BY OpportunityId, CreatedDate
```

4 Objects → events

Salesforce object	Becomes in the event log
Opportunity	Case: Id, Amount, IsWon, region
OpportunityHistory	Stage events: StageName, CreatedDate
Task (WhatId)	Activities: Subject, created → completed
Lead (ConvertedOpportunityId)	Lead Created event

Salesforce trial org: seed.py loaded 40 [Demo] accounts and opportunities to simulate a client's CRM.

extract.py: four SOQL queries over the REST API, signed by the Salesforce CLI session. Output: CSV and XES.

Prototype today, production next

What the prototype proves

- SOQL over REST, signed by the CLI session; no stored credentials
- Opportunity as the case; Tasks join on WhatId, Leads on ConvertedOpportunityId
- History rows collapse to real stage changes; paginated queries
- CSV and XES export with start and complete events

Known limits

- Task created → completed can include queueing time
- Open tasks have no completion time yet
- Trial orgs can't backdate history, so the analysis uses simulated data
- Import into a process mining tool still to verify

Production path

- Bulk API 2.0 with incremental refresh on SystemModstamp
- Stable event IDs and deterministic ordering for timestamp ties
- Approval history from ProcessInstance and its steps
- Reconciliation and data-quality checks against source counts

The plumbing is proven. What's left is event semantics and data quality, not connectivity.
