From Salesforce data to a framed value case

Lead-to-close process intelligence: a working demo build

Luke Audie · October 2026

The answer first: three process fixes worth $1.4M a year

$1.4M

Annual revenue upside if half of the gap is closed on three issues found in the CRM data. Full gap: $2.8M.

Sized from 800 opportunities over 10.4 months.

Accelerate revenue

EMEA discount approvals take 7.0 days vs 1.2 in the fastest region.

Improve win rate

19% of negotiated deals loop back for a re-quote; they win 31% vs 49%.

Sales productivity

12% of deals skip Qualification and win 18% vs 39%.

800	37%	33.9d	67	14%
deals analysed	win rate	median cycle time	distinct paths	follow the happy path

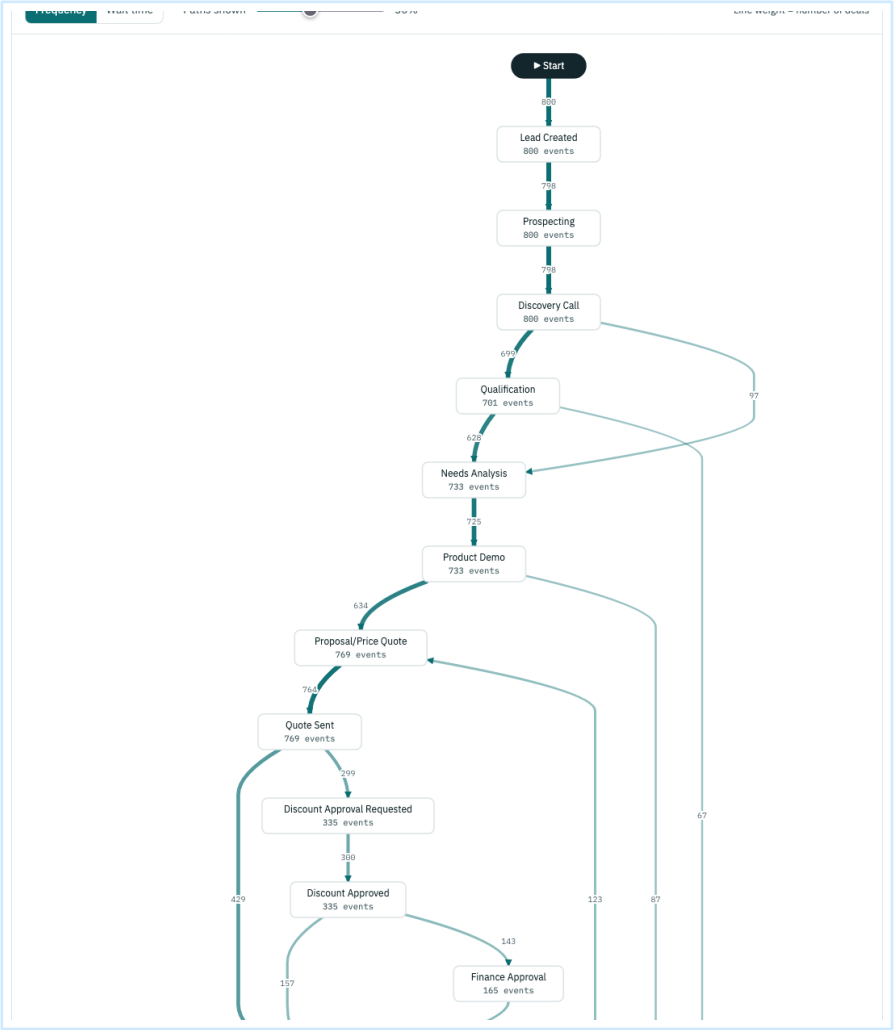

Salesforce → event log → process mining → value case

Discover: the process as it actually runs

14% of deals follow the designed happy path

67 distinct paths across 800 deals

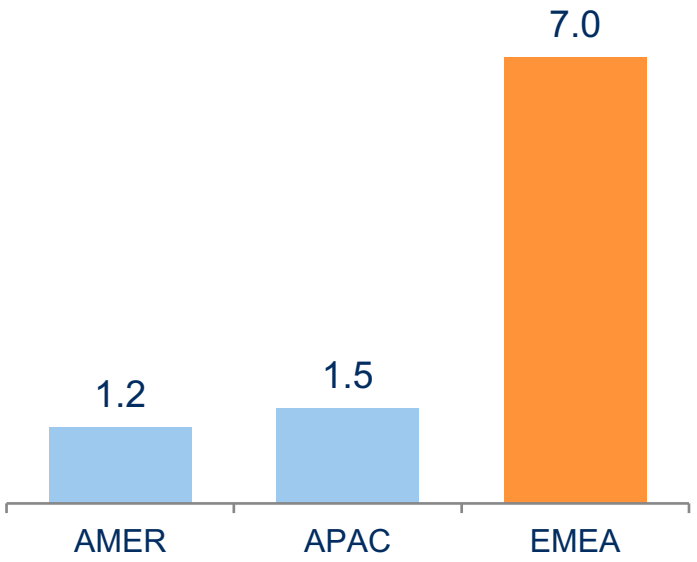

7.0 days median EMEA approval wait, the slowest hand-off

Approval steps and re-quote loops show up as detours from the designed path.

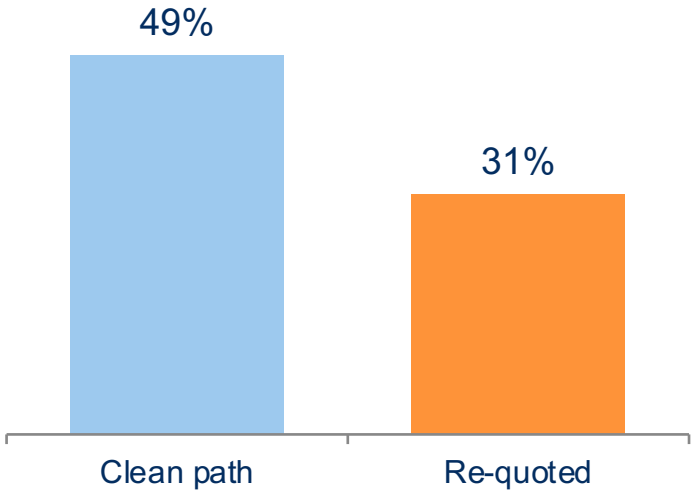

Diagnose: three deviations explain most of the lost value

Median approval wait (days)

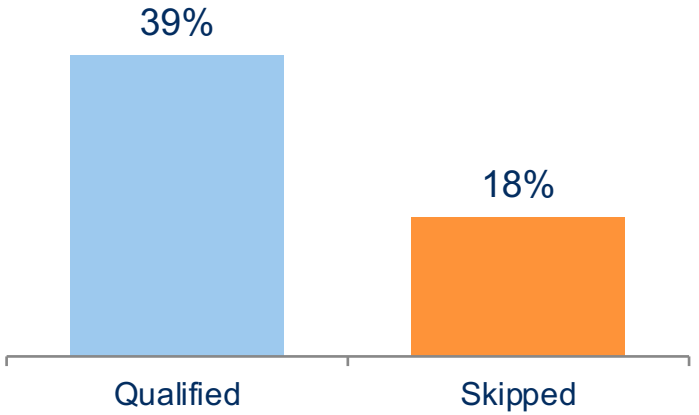

EMEA's single approver adds about 6 days per discounted deal.

Win rate of negotiated deals

19% of negotiated deals are re-quoted, and they win 18 points less often.

Win rate by qualification

12% of deals skip Qualification and win less than half as often.

Value case: reduce re-quotes in quote-to-close

Time frame: 2025-10 to 2026-09 · New business · Deals that reached Negotiation · Owner: VP Revenue Operations

Challenge

- 750 negotiated deals a year; 19% loop back for a re-quote
- Re-quoted deals win 31% vs 49%
- EMEA approvals take 7.0 days vs 1.2

Root cause (to capture)

- Reason codes: quote expired, discount, scope, pricing error
- Hotspots by approver queue, region and rep
- Confirm: slow approval → expired quote → re-quote

Solution with Apromore

- Performance views show where quotes wait and loop
- Conformance checking flags skipped steps
- Simulate a delegated EMEA approval threshold first

Negotiated deals / yr		Re-quotes per deal		Win-rate gap		Average won deal		Improvement		
750	×	0.19	×	17.5 pts	×	$53k	×	50%	=	≈ $669k revenue upside p.a.

Assumptions: annualised from 10 months of history; win-rate gap compares only deals that reached Negotiation; cycle-time gains not counted; half of the gap closed.

Tech setup

How the data gets from a Salesforce org into an Apromore-ready event log

From Salesforce to an event log in four steps

1

Extract

SOQL over REST

Lead, Opportunity, OpportunityHistory and Task, signed by the Salesforce CLI session. No stored credentials.

2

Correlate

One case per deal

Case ID = Opportunity Id. Tasks join on WhatId, Leads on ConvertedOpportunityId.

3

Load

Event log

CSV and IEEE XES with activity, timestamps, resource and case attributes, ready for Apromore.

4

Mine and size

Map and value

Directly-follows graph, variant analysis, cohort win rates and a driver-based value model.

Live run on a Salesforce trial org: 40 opportunities · 351 events · 2 objects joined · CSV + XES for Apromore

Data model: Salesforce objects to an event log

Event log field	Salesforce source
Case ID	Opportunity.Id
Lead Created	Lead.CreatedDate, joined on Lead.ConvertedOpportunityId
Stage activities	OpportunityHistory.StageName and CreatedDate; repeated rows collapse to real stage changes
Task activities	Task.Subject, CreatedDate → CompletedDateTime, joined on Task.WhatId
Resource	CreatedBy.Name (stage changes), Owner.Name (tasks)
Case attributes	Opportunity.Amount, LeadSource, IsWon; Account.Industry, BillingCountry → region

Output: one row per event

case_id, activity, start_time, end_time, resource, source_object, region, industry, lead_source, amount, outcome

```
006WV…YAB  Qualify
006WV…YAB  Discovery Call
006WV…YAB  Closed Lost
```

Written as CSV for Apromore's import and as IEEE XES with start/complete lifecycle events.

Running it against a brand-new trial org

Steps

1. **Authenticate**

   sf org login web: the CLI session signs every API call; no stored passwords.

2. **Seed**

   seed.py loads 40 [Demo] deals and walks them through stages via the Composite API.

3. **Extract and mine**

   extract.py → transform.py → mine.py write the event log and insights.

4. **Publish**

   build_site.py renders the dashboard and value case; deployed to Vercel.

Problems solved along the way

New orgs block uninstalled connected apps

Installed Salesforce CLI under Connected Apps OAuth Usage.

Starter orgs use a shorter sales process

Stages auto-map to Qualify → Propose → Negotiate.

The CLI redacts access tokens

Calls go through sf api request rest instead.

History can't be backdated

The 10-month dataset is simulated in the same object shape.

Everything is live and open to inspect

Process dashboard

salesforce-process-intelligence.vercel.app

Value case one-pager

Turning the finding into a decision

Validate

Run the same extract on the production org and confirm approval waits and re-quote rates with RevOps.

Act

Pilot a delegated approval threshold for EMEA discounts up to 30% and make Qualification a required gate.

Monitor

Schedule the extract into Apromore, track the KPIs against target and report value realised quarterly.
